The high performance for Photoshop CS6 and later is ensured by their architecture that houses a single architecture of the Photoshop Engine that supports all major features of Adobe's Creative Suite, and is now a strategic core part of Photoshop. The Photoshop Engine has also been optimized and increased in performance by shedding a significant portion of the legacy DirectX-based architecture. Each image preview and raster and vector tool can see a massive performance increase, especially in big image content transfers like TIFFs, GIFs, PNGs, or EPS files that are exported from the editor. With this updated architecture, the new generated image previews seen in the tools can be up to five times faster than previous versions. This performance gain also brings new improvements for the built-in RAW engine, which now provides faster file viewing, editing, and batch processing without waiting for a preview buffer to refresh. Another Photoshop Engine skill set that experienced users will appreciate is the ability to remove workspace and toolbars while working in the browser. This new great feature will reduce the size of Photoshop to only what is needed. This also allows for other tabs and browser windows to be active without attaching to the main Photoshop window. The Single Sign-On (SSO) feature is another important upgrade that allows users to quickly log in to Photoshop without entering details via a popup window. SSO, which was initially designed for the Adobe Workflow product line, also makes it easier for users to log into other apps and websites with fewer steps.
